Introduction to Linux – Part 2

Zhiyu (Drew) Li & Wim Cardoen
Research Consulting & Faculty Engagement
Center for High Performance Computing
{zhiyu.li; wim.cardoen}@utah.edu

Linux Virtual Machine

- ☐ Get a temporary account (or use your own CHPC account)
- ☐ Virtual Machine FastX portal: https://linuxclass.chpc.utah.edu:3300
- ☐ Open a XFCE Terminal
 - \square Adjust Font size: Edit \rightarrow Preferences \rightarrow Appearance \rightarrow Click on Font \rightarrow adjust Font Size
- ☐ Use Bash shell (quick check: echo \$SHELL)
- ☐ Copy and Paste issue on Mac

Editors

There are many choices – a few are:

□nano

☐ vi/vim

emacs

Nano Editor

To start either

nano

OR

nano filename

- -- if filename exists, it will open file in editor; if it does not, this will be the name used when you save the file.
- -- if you start nano without a filename it will prompt you for a name when you "WriteOut" using ^O (Cntrl O)

Nano cheat sheet: https://www.nano-editor.org/dist/latest/cheatsheet.html

Vi editor

- ☐ Another common choice
 - ☐Start with the command vi or vi filename
 - ui at CHPC is actually vim, which is an improved version of vi
 - More feature rich, takes more time to learn
- ☐ Not going into detail but we do provide a vi cheat sheet and a vi graphical cheat sheet linked on the presentation page https://www.chpc.utah.edu/presentations/IntroLinux3parts.php
- ☐ There is also a tutor program start with command vimtutor which is a great tool to learn to use the program

Loops

- ☐ Used when you want to preform the same action many times, such as on multiple files
- ☐ There are a number of ways you can do this
- ☐One option
 - ☐ List multiple arguments for a command to act upon
 - □ Example (go to the LinuxClass/shell-lesson-data/exercise-data/creatures directory):
 - □head -n 3 basilisk.dat minotaur.dat unicorn.dat
- ☐Another option do a loop with a for/do statement

Loop Terminology

☐ in bash syntax a loop looks like:

```
Bash

for thing in list_of_things
do
    operation_using $thing # Indentation within the loop is not required, but aids legibility
done
```

- □In this loop **thing** is a **variable**. During execution **\$thing** is set to the first item in the list, the operation(s) is done, then it goes to the second and repeats the operation(s), etc until it reaches the last item in the list. Then the loop is exited.
- ☐You can choose anything for **thing** however, your choice of the what to use for thing should help a person reading the file understand what the loop is doing and what it is acting upon

Exercise

☐ in bash syntax a loop looks like:

```
for thing in list_of_things
do
    operation_using $thing # Indentation within the loop is not required, but aids legibility
done
```

- ☐Go to the directory shell-lesson-data/exercise-data/proteins and write a loop that lists all of the pdb files
- ☐ Write a loop that prints all file names can use **echo** command
- ☐ Build upon this loop by adding another command
 - □Copy each file to a new name based on the existing name, file.pdb to orig-file.pdb
- ☐Add another command to the loop to make a single file that has the content of all of the pdb files in this directory
 - ☐ can use redirect >, >>

```
for file in *.pdb
do
echo $file
cp $file orig-$file
cat $file >> all.pdb
done
```

Exercise - Nelle's Data

- ☐ To process her data files Nelle will need to run an analysis on each of her sample files in north-pacific-gyre. The files to be processed have the consistent names of NENExxxxA.txt and NENExxxxB.txt ☐ The analysis requires running a script – more on this next time – written by her supervisor is called goostats.sh; this script acts on one sample file at a time; it requires two arguments – the input file name and the output file name. □bash goostats.sh <INPUT> <OUTPUT> □ Nelle decides to call the output file **stats-NENExxxA.txt** – prepending the filename with stats-☐ She is being careful so she wants to test (using echo instead of running the script
- ☐ Hint start with 1 file and run test to create the two arguments. You can prepend a variable with additional information: stats-\$variable

Exercise – Nelle's Data Answer

```
☐ To make sure getting all of the files
   for datafile in NENE*A.txt NENE*B.txt
    do
      echo $datafile
   done
☐ Test getting the output file name
   for datafile in NENE*A.txt NENE*B.txt
    do
      echo $datafile stats-$datafile
   done
☐ Executing the script across all files
   for datafile in NENE*A.txt NENE*B.txt
    do
     echo $datafile
     bash goostats.sh $datafile stats-$datafile
    done
```

Some other useful Linux commands

```
□cut-e.g. cut -d , -f 2 file.csv
   ☐ Prints selected parts of lines from file to standard output (screen)
□du – e.g. du –hs
   □Scan a given file/directory (and subdirs) and report space usage; -s give
    summary of total usage, -h gives it in "human readable" format of K, M, G
\Boxdf – e.g. df – h
   Overview of file system disk space usage (-h: human readable)
□ln-e.g. ln -s ~/bin/prog.exe prog1.exe
```

On your own – Use and explore options of these commands

☐ create a link between files (-s symbolic)

Linux File Permissions

```
□Shown with 1s -1
\squareUser (u), group (g), other (o)
   □-rw-rw-r-- 1 u0028729 chpc 86 Jul 30 02:41 notes.txt
☐ Can also use a for all to set u, g, and o to same settings
\squarePermissions are read (r), write (w), execute or search for a directory (x)
□chmod – to change permissions of file or directory, can set
□Examples:
   □chmod g=rwx file
   □chmod g+x file
   □chmod o-rwx *.c
☐ Executable files (programs and scripts) must have executable permissions; directories
 must be executable in order to be able to cd into them
   □chmod +x *.sh
```

Login Scripts & Environment Variables

- □ In your home directory are a number of dot files .bashrc and .custom.sh, .tcshrc and .custom.csh Depending on your shell choice, the appropriate pair of these are executed during login.

 □ These set the environment (as environment variables) needed for you to work on CHPC resources
- □Commands to check your environment: env or printenv
- ☐Some important variables
 - □\$USER
 - □\$HOME
 - □\$PATH paths to search for commands
 - □\$LD_LIBRARY_PATH paths to search for libraries when linking a program (more on that later)

Processes

☐ A Process is a running Linux program ☐ Each process has a PID (Process ID) **ps** reports a snapshot of current processes \Box ps, ps x Display ALL of your processes □ps ax Display ALL processes Display ALL processes (more detailed) □ps aux □ps auxw Display ALL processes (more detailed & unlimited width) □ps -eFwww Also displays ALL processes ☐ **kill PID** kills the process with the specified PID ☐ killall processname kills all process with the processname **kill -9 PID** kills the process with the specified PID if a kill does not work

Other Job Controls

- ☐ Ctrl+C (^C) terminate the currently running process
- ☐ Ctrl-Z (^Z) suspends the currently running process
 - ☐ Example: ping www.byu.edu
- ☐ jobs: lists all jobs, with their number
- □ bg %n: puts current or specified job (%n) in the background and
- ☐ **fg** %**n**: bring suspended program back to the foreground, e.g., so that it occupies the shell until done
- □ & (ampersand) runs the job in the background
 - ☐ Example: sleep 10

Monitoring processes/usage

- ☐ uptime how long the system has been running
- ☐ **free** memory and swap usage
- ☐ top show processes and resources usage in real time
 - ☐ atop (enhanced version; available on CHPC clusters)
 - ☐ htop (enhanced version; available on CHPC clusters)
- □ sar historical system usage report (cpu, memory, I/O...)

Moving files to/from CHPC

https://www.chpc.utah.edu/documentation/data_services.php ☐ Can mount CHPC file systems on your local machine (Windows, Mac or Linux), must be on campus or using the campus VPN ☐ Windows – there are graphical tools such as WinSCP ☐ Mac, Windows, cloud options — cyberduck, another graphical tool ☐ Linux □ scp command (secure shell copy) – to copy files between linux systems ☐ wget – to download from web with URL **Dcurl** is another option ☐ For larger data sets – look into the Data Transfer Nodes (DTNs) and transfer tools such as Globus, see □ https://www.globus.org/quickstart https://www.chpc.utah.edu/documentation/data_services.php
